Summary: Post Polio Syndrome-Symptoms, Treatment, Causes
Post polio syndrome is a condition wherein an individual who had been infected or had contracted polio will experience different symptoms 15 to 30 years after the first paralytic attack happened. Post polio syndrome is not really fatal; however, it can greatly affect the individual’s day to day activities. Post-polio syndrome is a condition that strikes survivors of the disease polio. PPS occurs about 20-30 years after the original bout with polio, and causes slow but progressive weakening of muscles. Post-polio Syndrome (PPS) is a condition that affects polio survivors many years after recovery from an initial attack of the poliomyelitis virus. PPS is characterized by a further weakening of muscles that were previously affected by the polio infection. Post Polio syndrome is a condition that can affect polio survivors many years after recovery from an initial serious attack of the poliomyelitis virus.
Who Needs the Polio Vaccine. Most people should get the polio vaccine when they are children. Children should be vaccinated with four doses of IPV at the following ages: A dose at 2 months. A dose at 4 months. A dose at 6-18 months. A booster dose at 4-6 years.

Post-Polio Syndrome - Drugs.com
The hallmark of post-polio syndrome is new muscular weakness. This may present as weakness in the arms, legs, or trunk or difficulty with swallowing, talking or breathing if the muscles that control these functions are affected.
